    if index != -1:  
        answer = input("Do you want to replace the substring? (yes/no): ")  
  
        while answer.lower() not in ["yes", "no"]:  
            print("Invalid choice. Please type yes or no.")
```

```
answer = input("Do you want to replace the substring? (yes/no): ")

if answer.lower() == "yes":
    new_string = get_input("Enter the new string: ")
    updated = main_string.replace(sub_string, new_string)
    print("Updated string:", updated)
else:
    print("No replacement was made.")

print("\nThank you for using the program!")
print("Completed by, Manuel Vargas")
```

This program searches for a substring and can replace it.

```
Enter the main string: For a Class
Enter the substring to search for: Class
The substring was found at index: 6
Do you want to replace the substring? (yes/no): yes
Enter the new string: this is a test
Updated string: For a this is a test

Thank you for using the program!
Completed by, Manuel Vargas
